1. About the Project

Crime Hotspot Analyzer and Secure Router

KAGS (crime Hotspot Analyzer and Safety Router)

A data-driven platform designed to help residents in the Seattle and Bellevue areas navigate their cities more safely by providing crime hotspot analysis and safety-optimized routing.

Customer Problem

- + Difficulty in identifying high-risk crime areas at a glance
- + Existing navigation systems do not account for route safety

Core Features

- + Crime data-based hotspot heatmap
- + Safety score-based route guidance with safer alternative routes

Expected Effect

- + Improved mobility safety by avoiding high-risk areas
 - + A safer, safety-focused urban mobility experience
-

2. Persona _ Chloe

Age : 26

Job : **Entry-level Software Engineer**

Context : Frequently travels between Bellevue, Seattle, and other surrounding areas for work. Due to changing projects and work environments, she has a nomadic lifestyle, often moving between different residential areas. She frequently works late nights, travels for business, and carries expensive professional equipment (laptops, monitors, etc.).

Problem Statement : Current navigation apps fail to sufficiently reflect public safety data or risk factors. Consequently, she lacks clear criteria or information to assess the safety of a route before traveling.

3. PAIN POINT

Information Uncertainty

Difficulty in knowing whether a perpetrator has been apprehended or the direction of their escape after a crime occurs, leading to discomfort.

Lack of Reliable Data

Frustration caused by the lack of specific safety ratings for locations such as parking lots or specific public spaces.

Contextual Risk Exposure

High anxiety during specific situations, such as commuting late at night or carrying heavy, high-value equipment.

4. Core Hypotheses to Validate

Users who frequently travel alone at night will choose a **safer route** if provided with public safety information before their journey.

When provided with safety data, these users will prioritize "**avoiding danger zones**" over "shortest travel time" as their primary decision-making criterion.

Users will trust the service more when the **reasoning** (such as specific danger zones and incident history) is provided alongside the safety rating, rather than receiving a simple "safe/unsafe" result.

5. MVP Development Plan

Step 1.

Core Feature Implementation

Visualize crime data for the Seattle and Bellevue areas to display identified danger zones on a map.

Step 2.

Route Selection

Enable users to compare and choose between the "Fastest Route" and the "Safest Route."

Step 1.

Filtering System

Develop a filtering feature that allows users to view specific types of crimes, such as theft or assault, based on their personal concerns.
