

NextGen Startup Challenge 2026

Real-time Public Transit Information System

#1 Project Overview

- Project Introduction
- Project Goals

1. Project Introduction

(1) 프로젝트 개요

Project Name - Sound Sync

Project Topic - App design to improve user inconvenience caused by traffic congestion in downtown Seattle.

Core Feature - Integration of real-time traffic and weather information, Estimated Time of Arrival (ETA), and maps.

(2) Current Problems

- Fragmented information and difficulty in real-time searching.
- Hard to deliver urgent information updates to users.

(3) Core Values & Solution

Values: Route tracking / Delay alerts / Safety issues.

Solution: Reducing uncertainty and increasing safety through accurate and immediate info.

2. 2. Project Goals

GOAL 1 - Real-time Traffic Tracking

Provide accurate bus locations, route conditions, arrival delays, and estimated arrival times.

GOAL 2 - Safety Reinforcement

Provide real-time safety alerts, disaster notifications, and other critical info updates.

GOAL 3 - User Convenience

Unified platform for arrival times, route changes, and weather to reduce information confusion.

GOAL 4 - Reducing Information Gap

Centralized data management allows users to move away from unreliable and scattered information.

#2 Persona & Pain Points

- Persona Introduction
- Scenario Composition
- Pain Point Summary

1. Persona Introduction

[Basic Information]

Female in her 40s, single-parent household (3 kids), low income. Works as a visiting caregiver (AM) and a mart clerk (PM).

[Residence & Commute]

Lives in Seattle outskirts. No car.
Relies 100% on public transport for an 80-minute commute.

[Key Insight]

"Transportation issues like 'Ghost Buses' act as a direct threat to her livelihood."

2. Scenario Composition

10:00

Waits for bus after school drop-off.
I-5 congestion causes 30-min delay.
Receives a warning of dismissal from boss.

[밤] : 21:00

old winter night. "Ghost Bus" causes 1-hour delay.
Arrives 2 hours late;
kids eat processed food while waiting.

14:00

Heading to work at mart.
No direct bus to outskirts. Constantly monitors
fragmented routes and schedules..

3. Pain Point Summary

<KEY point>

- "100% bus reliance, directly hit by I-5 traffic and Seattle's severe weather."

Pain Points 1 - Job Insecurity due to Tardiness

Currently under warning of dismissal due to frequent and unpredictable bus delays.

Pain Points 2 - Information Fragmentation

Needs to switch between multiple apps to check weather, accident alerts, and bus GPS locations.

Pain Points 3 - Unpredictability (Ghost Bus)

Inaccurate ETA or buses vanishing without notice poses safety threats during late-night hours

#3 Hypotheses & MVP Plan

- Hypothesis Summary
- MVP Production Plan
- Local Validation Methods

1. Hypothesis Summary

Hypothesis 1 (Problem-Customer Fit):

Integrating weather, risk alerts, and GPS data will eliminate commute uncertainty and reduce actual travel time.

Hypothesis 2 (Service Reliability):

Analysis of Seattle's rain/snow and rush hour will prove data discrepancies of 10+ minutes in existing apps.

Hypothesis 3 (Problem-Market Fit):

Target users will accept banner ads if the information accuracy for their commute is guaranteed.

2. MVP Production Plan

Essential core functions
and key integration points
of the MVP:

Real-time risk alerts & detour info
during accidents or bad weather.

**Core
Function**

+

Visual mapping of Weather/Detour APIs
integrated with bus GPS data.

**Data
Integration**

3. Local Validation Methods

Method	Contents
Data Measurement	Comparing actual bus arrival times with app data at stops during rush hour and various weather conditions.
User Interview	Qualitative interviews with passengers about major factors affecting commute time (weather, congestion, etc.).
Field VOC	Collecting user feedback and functional suggestions via Google Forms using QR codes attached to bus stops.
